Introduction to the Case Study

In today's competitive academic and professional environment, internships play an important role in helping students gain practical experience and industry exposure. However, students often find it difficult to locate suitable internships because opportunities are spread across multiple platforms. This case study presents the development of InternPath, a simple internship aggregation platform designed to help students easily search and filter internship opportunities based on their preferences.

The system collects internship listings and presents them in an organized format where users can explore opportunities based on criteria such as location, duration, and remote availability. The platform is designed using basic web development technologies to demonstrate how a simple system can improve accessibility and organization of internship information.

Case Background (Abstract)

Many students face challenges while searching for internships because the information is scattered across different websites and platforms. This makes the process time-consuming and inefficient. Students also want to search for internships based on specific requirements such as preferred location, remote work options, and internship duration.

The purpose of this project is to design a centralized internship aggregator platform that simplifies the process of searching and viewing internships. The system allows companies to post internship opportunities and enables students to browse and filter them easily. By providing an organized platform with filtering features, the system helps students quickly find internships that match their interests and requirements.

Case Study Design

The InternPath system is designed as a web-based platform that connects companies offering internships with students searching for opportunities. The platform consists of multiple web pages that work together to provide a smooth user experience.

The homepage acts as the starting point for users, where they can navigate to different sections of the platform. The jobs page displays all available internship opportunities with basic details such as company name, role, location, and duration. The filters page allows users to refine the list of internships by selecting specific preferences such as location or remote internships.

When a student selects an internship from the list, they can visit the For Companies page (company.html), where companies can post internship listings and partner with the platform.The system design ensures that users can easily navigate between pages and quickly find relevant internship opportunities.

Methods & Algorithms Technology Applied in the Problem Statement / Case Study

The project uses fundamental web technologies to build a functional internship search platform.

HTML (HyperText Markup Language) is used to structure the web pages and create different sections such as internship listings, a page for companies to post internships, and filter options.

CSS (Cascading Style Sheets) is used to style the website and improve its visual appearance. It helps in designing layouts, formatting text, and highlighting elements such as remote internship labels.

JavaScript is used to implement the interactive features of the platform. It processes user inputs from the filter options and dynamically updates the internship listings displayed on the screen.

The main algorithm used in the system is a filtering and sorting mechanism. When a user selects filter options, the JavaScript function compares the selected criteria with the available internship data and displays only the matching results. This improves efficiency and helps students quickly locate relevant internships.

Folder Structure Chart:

```
InternPath/
│
├── images/
├── index.html        → Homepage (Find Your Perfect Internship)
│
├── jobs.html         → Browse Jobs Page (All internship listings)
│
├── filters.html      → Smart Filters Page (Advanced search)
│
├── company.html      → For Companies Page (Post-internship / Partner)
│
├── script.js         → All JavaScript Logic
│
└── style.css         → All styling (colors, layout, cards)
```

Case Study Implementation Details and Snapshots

The implementation of the InternPath system consists of several interconnected web pages and supporting files.

The index.html file serves as the homepage where users begin their interaction with the platform. The jobs.html page displays internship listings in an organized format so that students can easily browse opportunities.

The filters.html page allows users to apply search filters such as location, internship duration, and remote availability. These filter selections are processed by the JavaScript file (script.js), which dynamically updates the displayed results.

The company.html page provides a form to post internships . Additionally, the project includes a CSS stylesheet (style.css) that defines the layout, colors, and styling of all pages to ensure a consistent and user-friendly design.

Case Study Results and Conclusion

The InternPath platform successfully demonstrates how a simple internship aggregator can improve the process of searching for internships. The system allows students to browse internship opportunities in one place and refine their search using filters based on their preferences.

By combining HTML, CSS, and JavaScript, the project provides an interactive and user-friendly platform for exploring internships. The filtering functionality helps reduce the time required to find relevant opportunities, making the process more efficient for students.

In conclusion, the InternPath system highlights the importance of organized internship platforms and shows how basic web technologies can be used to build useful applications that benefit students and companies.
